

6V~30V Mini Infrared PIR Motion Sensor Detector Module

Smallest PIR Movement Sensor Module with Shield

Package:

- PIR Movement Sensor Module (Model No.: 0040101)
- User Manual

Feature:

- The module can accurately detect any moving objects (e.g. human body) within the detectable range and will send out signals of high level for a certain time. It has higher sensitivity and broader detectable range than others.
- Completely automatic induction: once a person enters into the detectable range, the output is high level. While the person is out of the detectable range, it will prolong automatically 20 seconds of retention time then the high level output will be shifted to the low level output.
- Triggering method: repeated triggering, which means that it will take the last triggering time as the starting point, within 20 seconds of the high level output, if there's still human beings activities within its detectable zone, the output will be maintained in the high level until the person's leave. Then afterwards, a retention time of 20 seconds will be initiated.
- Broad working voltage, low power consumption.
- High level signal output, easy to be butt jointed with different types of circuits.
- The module is widely accepted and has been applied for movement detection, automatic control, proximity switch, electronic theft prevention, safety protection, remote control measurement.

Specification:

- Operating temperature range: -20°C ~ +70°C (-4°F ~ 158°F)
- Working voltage: DC 6V~30V
- Static current: 3~5mA
- Output: 5V / 15mA
- Retention time of high level output: 20 seconds
- Detectable range: 2~3m (Normal)
- Detectable angle: <140°
- Triggering method: repeated triggering
- Dimensions: 27mm × 12mm × 12mm
- Weight: 2g / 0.07oz

Notice: When the human body approaches the module from its side in a horizontal movement, the sensitivity will reach the highest level, while in a vertical movement, the lowest level.

Application Chart: 9V
